

ABSTRACT OF THE DISCLOSURE

An electric oven includes a cabinet within which is arranged an oven cavity. Arranged below a bottom portion of the oven cavity is a combination convection/radiant bake cooking system adapted to derive
5 heat energy from a single heat source. The oven preferably includes a central opening in the bottom portion within which is arranged a glass panel. Arranged about a periphery of the central opening are a plurality of vented openings adapted to introduce a convective airflow into the oven cavity. The glass panel provides both a conductive heat surface
10 transmitting radiant heat energy into the oven cavity and a viewing surface allowing a consumer to view the operation of the heat source.
